INTRODUCTION ..... 21
FIGURES ..... 22
DEFINITION OF BACKGROUND AND DEMOGRAPHIC SUBGROUPS
[This information also appears as Appendix B of Monitoring the Future National Survey Results on Drug Use, 1975-2022: Secondary School Students] ..... 490
TRENDS BY SUBGROUP: SUPPLEMENTAL TABLES FOR SECONDARY SCHOOL STUDENTS
[These tables complement Appendix C of Monitoring the Future National Survey Results on Drug Use, 1975-2022: Secondary School Students] ..... 494
TABLES ..... 495

## LIST OF FIGURES GIVING DEMOGRAPHIC SUBGROUP TRENDS

NOTE: The lists of figures and tables provided below contain clickable links to all graphics and tables in the paper.
Any Illicit Drug: Trends in Annual Prevalence
By Gender (Figure 1) ..... 22
By College Plans (Figure 2) ..... 23
By Region (Figure 3) ..... 24
By Population Density (Figure 4) ..... 25
By Average Education Level of Parents (Figure 5) ..... 26
By Race/Ethnicity (Figure 6) ..... 27
Any Illicit Drug other than Marijuana: Trends in Annual Prevalence
By Gender (Figure 7) ..... 28
By College Plans (Figure 8) ..... 29
By Region (Figure 9) ..... 30
By Population Density (Figure 10) ..... 31
By Average Education Level of Parents (Figure 11) ..... 32
By Race/Ethnicity (Figure 12) ..... 33
Marijuana: Trends in Lifetime Prevalence
By Gender (Figure 13) ..... 34
By College Plans (Figure 14) ..... 35
By Region (Figure 15) ..... 36
By Population Density (Figure 16) ..... 37
By Average Education Level of Parents (Figure 17) ..... 38
By Race/Ethnicity (Figure 18) ..... 39
Marijuana: Trends in Annual PrevalenceBy Gender (Figure 19)40
By College Plans (Figure 20) ..... 41
By Region (Figure 21) ..... 42
By Population Density (Figure 22) ..... 43
By Average Education Level of Parents (Figure 23) ..... 44
By Race/Ethnicity (Figure 24) ..... 45
Marijuana: Trends in 30-Day Prevalence
By Gender (Figure 25) ..... 46
By College Plans (Figure 26). ..... 47
By Region (Figure 27) ..... 48
By Population Density (Figure 28) ..... 49
By Average Education Level of Parents (Figure 29) ..... 50
By Race/Ethnicity (Figure 30) ..... 51

## LIST OF FIGURES (continued)

Marijuana: Trends in 30-Day Prevalence of Daily Use By Gender (Figure 31) ..... 52
By College Plans (Figure 32) ..... 53
By Region (Figure 33) ..... 54
By Population Density (Figure 34) ..... 55
By Average Education Level of Parents (Figure 35) ..... 56
By Race/Ethnicity (Figure 36) ..... 57
Synthetic Marijuana: Trends in Annual Prevalence
By Gender (Figure 37) ..... 58
By College Plans (Figure 38) ..... 59
By Region (Figure 39) ..... 60
By Population Density (Figure 40) ..... 61
By Average Education Level of Parents (Figure 41) ..... 62
By Race/Ethnicity (Figure 42) ..... 63
Inhalants: Trends in Annual Prevalence
By Gender (Figure 43) ..... 64
By College Plans (Figure 44) ..... 65
By Region (Figure 45) ..... 66
By Population Density (Figure 46) ..... 67
By Average Education Level of Parents (Figure 47) ..... 68
By Race/Ethnicity (Figure 48) ..... 69
Hallucinogens: Trends in Annual Prevalence
By Gender (Figure 49) ..... 70
By College Plans (Figure 50) ..... 71
By Region (Figure 51) ..... 72
By Population Density (Figure 52) ..... 73
By Average Education Level of Parents (Figure 53) ..... 74
By Race/Ethnicity (Figure 54) ..... 75
LSD: Trends in Annual Prevalence
By Gender (Figure 55) ..... 76
By College Plans (Figure 56) ..... 77
By Region (Figure 57) ..... 78
By Population Density (Figure 58) ..... 79
By Average Education Level of Parents (Figure 59) ..... 80
By Race/Ethnicity (Figure 60) ..... 81
Hallucinogens other than LSD: Trends in Annual Prevalence By Gender (Figure 61) ..... 82
By College Plans (Figure 62) ..... 83
By Region (Figure 63) ..... 84
By Population Density (Figure 64) ..... 85
By Average Education Level of Parents (Figure 65) ..... 86
By Race/Ethnicity (Figure 66) ..... 87

## LIST OF FIGURES (continued)

MDMA (Ecstasy, Molly): Trends in Annual Prevalence By Gender (Figure 67) ..... 88
By College Plans (Figure 68) ..... 89
By Region (Figure 69) ..... 90
By Population Density (Figure 70) ..... 91
By Average Education Level of Parents (Figure 71) ..... 92
By Race/Ethnicity (Figure 72) ..... 93
Salvia: Trends in Annual Prevalence
By Gender (Figure 73) ..... 94
By College Plans (Figure 74) ..... 95
By Region (Figure 75) ..... 96
By Population Density (Figure 76) ..... 97
By Average Education Level of Parents (Figure 77) ..... 98
By Race/Ethnicity (Figure 78) ..... 99
Cocaine: Trends in Annual Prevalence
By Gender (Figure 79) ..... 100
By College Plans (Figure 80) ..... 101
By Region (Figure 81) ..... 102
By Population Density (Figure 82) ..... 103
By Average Education Level of Parents (Figure 83) ..... 104
By Race/Ethnicity (Figure 84) ..... 105
Crack: Trends in Annual Prevalence
By Gender (Figure 85) ..... 106
By College Plans (Figure 86) ..... 107
By Region (Figure 87) ..... 108
By Population Density (Figure 88) ..... 109
By Average Education Level of Parents (Figure 89) ..... 110
By Race/Ethnicity (Figure 90) ..... 111
Cocaine other than Crack: Trends in Annual Prevalence
By Gender (Figure 91) ..... 112
By College Plans (Figure 92) ..... 113
By Region (Figure 93) ..... 114
By Population Density (Figure 94) ..... 115
By Average Education Level of Parents (Figure 95) ..... 116
By Race/Ethnicity (Figure 96) ..... 117
Heroin: Trends in Annual Prevalence
By Gender (Figure 97) ..... 118
By College Plans (Figure 98) ..... 119
By Region (Figure 99) ..... 120
By Population Density (Figure 100) ..... 121
By Average Education Level of Parents (Figure 101) ..... 122
By Race/Ethnicity (Figure 102) ..... 123

## LIST OF FIGURES (continued)

Heroin with a Needle: Trends in Annual Prevalence
By Gender (Figure 103) ..... 124
By College Plans (Figure 104) ..... 125
By Region (Figure 105) ..... 126
By Population Density (Figure 106) ..... 127
By Average Education Level of Parents (Figure 107) ..... 128
By Race/Ethnicity (Figure 108) ..... 129
Heroin without a Needle: Trends in Annual Prevalence
By Gender (Figure 109) ..... 130
By College Plans (Figure 110) ..... 131
By Region (Figure 111) ..... 132
By Population Density (Figure 112) ..... 133
By Average Education Level of Parents (Figure 113) ..... 134
By Race/Ethnicity (Figure 114) ..... 135
Narcotics other than Heroin: Trends in Annual Prevalence
By Gender (Figure 115) ..... 136
By College Plans (Figure 116) ..... 137
By Region (Figure 117) ..... 138
By Population Density (Figure 118) ..... 139
By Average Education Level of Parents (Figure 119) ..... 140
By Race/Ethnicity (Figure 120) ..... 141
OxyContin: Trends in Annual Prevalence
By Gender (Figure 121) ..... 142
By College Plans (Figure 122) ..... 143
By Region (Figure 123) ..... 144
By Population Density (Figure 124) ..... 145
By Average Education Level of Parents (Figure 125) ..... 146
By Race/Ethnicity (Figure 126) ..... 147
Vicodin: Trends in Annual Prevalence
By Gender (Figure 127) ..... 148
By College Plans (Figure 128) ..... 149
By Region (Figure 129) ..... 150
By Population Density (Figure 130) ..... 151
By Average Education Level of Parents (Figure 131) ..... 152
By Race/Ethnicity (Figure 132) ..... 153
Amphetamines: Trends in Annual Prevalence
By Gender (Figure 133) ..... 154
By College Plans (Figure 134) ..... 155
By Region (Figure 135) ..... 156
By Population Density (Figure 136) ..... 157
By Average Education Level of Parents (Figure 137) ..... 158
By Race/Ethnicity (Figure 138) ..... 159

## LIST OF FIGURES (continued)

Ritalin: Trends in Annual Prevalence
By Gender (Figure 139) ..... 160
By College Plans (Figure 140) ..... 161
By Region (Figure 141) ..... 162
By Population Density (Figure 142) ..... 163
By Average Education Level of Parents (Figure 143) ..... 164
By Race/Ethnicity (Figure 144) ..... 165
Adderall: Trends in Annual Prevalence
By Gender (Figure 145) ..... 166
By College Plans (Figure 146) ..... 167
By Region (Figure 147) ..... 168
By Population Density (Figure 148) ..... 169
By Average Education Level of Parents (Figure 149) ..... 170
By Race/Ethnicity (Figure 150) ..... 171
Provigil: Trends in Annual Prevalence
By Gender (Figure 151) ..... 172
By College Plans (Figure 152) ..... 173
By Region (Figure 153) ..... 174
By Population Density (Figure 154) ..... 175
By Average Education Level of Parents (Figure 155) ..... 176
By Race/Ethnicity (Figure 156) ..... 177
Methamphetamine: Trends in Annual Prevalence
By Gender (Figure 157) ..... 178
By College Plans (Figure 158) ..... 179
By Region (Figure 159) ..... 180
By Population Density (Figure 160) ..... 181
By Average Education Level of Parents (Figure 161) ..... 182
By Race/Ethnicity (Figure 162) ..... 183
Crystal Methamphetamine (Ice): Trends in Annual Prevalence
By Gender (Figure 163) ..... 184
By College Plans (Figure 164) ..... 185
By Region (Figure 165) ..... 186
By Population Density (Figure 166) ..... 187
By Average Education Level of Parents (Figure 167) ..... 188
By Race/Ethnicity (Figure 168) ..... 189
Bath Salts (Synthetic Stimulants): Trends in Annual Prevalence By Gender (Figure 169) ..... 190
By College Plans (Figure 170) ..... 191
By Region (Figure 171) ..... 192
By Population Density (Figure 172) ..... 193
By Average Education Level of Parents (Figure 173) ..... 194
By Race/Ethnicity (Figure 174) ..... 195

## LIST OF FIGURES (continued)

Sedatives (Barbiturates): Trends in Annual Prevalence
By Gender (Figure 175) ..... 196
By College Plans (Figure 176) ..... 197
By Region (Figure 177) ..... 198
By Population Density (Figure 178) ..... 199
By Average Education Level of Parents (Figure 179) ..... 200
By Race/Ethnicity (Figure 180) ..... 201
Tranquilizers: Trends in Annual Prevalence
By Gender (Figure 181) ..... 202
By College Plans (Figure 182) ..... 203
By Region (Figure 183) ..... 204
By Population Density (Figure 184) ..... 205
By Average Education Level of Parents (Figure 185) ..... 206
By Race/Ethnicity (Figure 186) ..... 207
Any Prescription Drug: Trends in Annual Prevalence
By Gender (Figure 187) ..... 208
By College Plans (Figure 188) ..... 209
By Region (Figure 189) ..... 210
By Population Density (Figure 190) ..... 211
By Average Education Level of Parents (Figure 191) ..... 212
By Race/Ethnicity (Figure 192) ..... 213
Over-the-Counter Cough/Cold Medicines: Trends in Annual Prevalence
By Gender (Figure 193) ..... 214
By College Plans (Figure 194) ..... 215
By Region (Figure 195) ..... 216
By Population Density (Figure 196) ..... 217
By Average Education Level of Parents (Figure 197) ..... 218
By Race/Ethnicity (Figure 198) ..... 219
Rohypnol: Trends in Annual Prevalence
By Gender (Figure 199) ..... 220
By College Plans (Figure 200) ..... 221
By Region (Figure 201) ..... 222
By Population Density (Figure 202) ..... 223
By Average Education Level of Parents (Figure 203) ..... 224
By Race/Ethnicity (Figure 204) ..... 225
Alcohol: Trends in 30-Day Prevalence
By Gender (Figure 205) ..... 226
By College Plans (Figure 206) ..... 227
By Region (Figure 207) ..... 228
By Population Density (Figure 208) ..... 229
By Average Education Level of Parents (Figure 209) ..... 230
By Race/Ethnicity (Figure 210) ..... 231

## LIST OF FIGURES (continued)

Alcohol: Trends in Daily Prevalence
By Gender (Figure 211) ..... 232
By College Plans (Figure 212) ..... 233
By Region (Figure 213) ..... 234
By Population Density (Figure 214) ..... 235
By Average Education Level of Parents (Figure 215) ..... 236
By Race/Ethnicity (Figure 216) ..... 237
Alcohol: Trends in 30-Day Prevalence of Having Been Drunk By Gender (Figure 217) ..... 238
By College Plans (Figure 218) ..... 239
By Region (Figure 219) ..... 240
By Population Density (Figure 220) ..... 241
By Average Education Level of Parents (Figure 221) ..... 242
By Race/Ethnicity (Figure 222) ..... 243
Alcohol: Trends in 2-Week Prevalence of 5 or More Drinks in a Row By Gender (Figure 223) ..... 244
By College Plans (Figure 224) ..... 245
By Region (Figure 225) ..... 246
By Population Density (Figure 226) ..... 247
By Average Education Level of Parents (Figure 227) ..... 248
By Race/Ethnicity (Figure 228) ..... 249
Alcohol: Trends in 2-Week Prevalence of 10 or More Drinks in a Row
By Gender (Figure 229) ..... 250
By College Plans (Figure 230) ..... 251
By Region (Figure 231) ..... 252
By Population Density (Figure 232) ..... 253
By Average Education Level of Parents (Figure 233) ..... 254
By Race/Ethnicity (Figure 234) ..... 255
Alcohol: Trends in 2-Week Prevalence of 15 or More Drinks in a Row
By Gender (Figure 235) ..... 256
By College Plans (Figure 236) ..... 257
By Region (Figure 237) ..... 258
By Population Density (Figure 238) ..... 259
By Average Education Level of Parents (Figure 239) ..... 260
By Race/Ethnicity (Figure 240) ..... 261
Beer: Trends in 30-Day Prevalence
By Gender (Figure 241) ..... 262
By College Plans (Figure 242) ..... 263
By Region (Figure 243) ..... 264
By Population Density (Figure 244) ..... 265
By Average Education Level of Parents (Figure 245) ..... 266
By Race/Ethnicity (Figure 246) ..... 267

## LIST OF FIGURES (continued)

Beer: Trends in 2-Week Prevalence of 5 or More Drinks in a Row By Gender (Figure 247) ..... 268
By College Plans (Figure 248) ..... 269
By Region (Figure 249) ..... 270
By Population Density (Figure 250) ..... 271
By Average Education Level of Parents (Figure 251) ..... 272
By Race/Ethnicity (Figure 252) ..... 273
Liquor: Trends in 30-Day Prevalence By Gender (Figure 253) ..... 274
By College Plans (Figure 254) ..... 275
By Region (Figure 255) ..... 276
By Population Density (Figure 256) ..... 277
By Average Education Level of Parents (Figure 257) ..... 278
By Race/Ethnicity (Figure 258) ..... 279
Liquor: Trends in 2-Week Prevalence of 5 or More Drinks in a Row
By Gender (Figure 259) ..... 280
By College Plans (Figure 260) ..... 281
By Region (Figure 261) ..... 282
By Population Density (Figure 262) ..... 283
By Average Education Level of Parents (Figure 263) ..... 284
By Race/Ethnicity (Figure 264) ..... 285
Wine: Trends in 30-Day PrevalenceBy Gender (Figure 265)286
By College Plans (Figure 266) ..... 287
By Region (Figure 267) ..... 288
By Population Density (Figure 268) ..... 289
By Average Education Level of Parents (Figure 269) ..... 290
By Race/Ethnicity (Figure 270) ..... 291
Wine: Trends in 2-Week Prevalence of 5 or More Drinks in a Row
By Gender (Figure 271) ..... 292
By College Plans (Figure 272) ..... 293
By Region (Figure 273) ..... 294
By Population Density (Figure 274) ..... 295
By Average Education Level of Parents (Figure 275) ..... 296
By Race/Ethnicity (Figure 276) ..... 297
Wine Coolers: Trends in 30-Day Prevalence
By Gender (Figure 277) ..... 298
By College Plans (Figure 278) ..... 299
By Region (Figure 279) ..... 300
By Population Density (Figure 280) ..... 301
By Average Education Level of Parents (Figure 281) ..... 302
By Race/Ethnicity (Figure 282) ..... 303

## LIST OF FIGURES (continued)

Wine Coolers: Trends in 2-Week Prevalence of 5 or More Drinks in a Row By Gender (Figure 283) ..... 304
By College Plans (Figure 284) ..... 305
By Region (Figure 285) ..... 306
By Population Density (Figure 286) ..... 307
By Average Education Level of Parents (Figure 287) ..... 308
By Race/Ethnicity (Figure 288) ..... 309
Flavored Alcoholic Beverages: Trends in 30-Day Prevalence By Gender (Figure 289) ..... 310
By College Plans (Figure 290) ..... 311
By Region (Figure 291) ..... 312
By Population Density (Figure 292) ..... 313
By Average Education Level of Parents (Figure 293) ..... 314
By Race/Ethnicity (Figure 294) ..... 315
Alcoholic Beverages containing Caffeine: Trends in Annual Prevalence By Gender (Figure 295) ..... 316
By College Plans (Figure 296) ..... 317
By Region (Figure 297) ..... 318
By Population Density (Figure 298) ..... 319
By Average Education Level of Parents (Figure 299) ..... 320
By Race/Ethnicity (Figure 300) ..... 321
Cigarettes: Trends in 30-Day Prevalence
By Gender (Figure 301) ..... 322
By College Plans (Figure 302) ..... 323
By Region (Figure 303) ..... 324
By Population Density (Figure 304) ..... 325
By Average Education Level of Parents (Figure 305) ..... 326
By Race/Ethnicity (Figure 306) ..... 327
Cigarettes: Trends in 30-Day Prevalence of Daily Use
By Gender (Figure 307) ..... 328
By College Plans (Figure 308) ..... 329
By Region (Figure 309) ..... 330
By Population Density (Figure 310) ..... 331
By Average Education Level of Parents (Figure 311) ..... 332
By Race/Ethnicity (Figure 312) ..... 333
Cigarettes: Trends in 30-Day Prevalence of Use of Half Pack a Day or More By Gender (Figure 313) ..... 334
By College Plans (Figure 314) ..... 335
By Region (Figure 315) ..... 336
By Population Density (Figure 316) ..... 337
By Average Education Level of Parents (Figure 317) ..... 338
By Race/Ethnicity (Figure 318) ..... 339

## LIST OF FIGURES (continued)

Tobacco using a Hookah: Trends in Annual Prevalence
By Gender (Figure 319) ..... 340
By College Plans (Figure 320) ..... 341
By Region (Figure 321) ..... 342
By Population Density (Figure 322) ..... 343
By Average Education Level of Parents (Figure 323) ..... 344
By Race/Ethnicity (Figure 324) ..... 345
Small Cigars: Trends in Annual Prevalence By Gender (Figure 325) ..... 346
By College Plans (Figure 326) ..... 347
By Region (Figure 327) ..... 348
By Population Density (Figure 328) ..... 349
By Average Education Level of Parents (Figure 329) ..... 350
By Race/Ethnicity (Figure 330) ..... 351
Flavored Little Cigars: Trends in 30-Day Prevalence
By Gender (Figure 331) ..... 352
By College Plans (Figure 332) ..... 353
By Region (Figure 333) ..... 354
By Population Density (Figure 334) ..... 355
By Average Education Level of Parents (Figure 335) ..... 356
By Race/Ethnicity (Figure 336) ..... 357
Regular Little Cigars: Trends in 30-Day Prevalence
By Gender (Figure 337) ..... 358
By College Plans (Figure 338) ..... 359
By Region (Figure 339) ..... 360
By Population Density (Figure 340) ..... 361
By Average Education Level of Parents (Figure 341) ..... 362
By Race/Ethnicity (Figure 342) ..... 363
Large Cigars: Trends in 30-Day Prevalence
By Gender (Figure 343) ..... 364
By College Plans (Figure 344) ..... 365
By Region (Figure 345) ..... 366
By Population Density (Figure 346) ..... 367
By Average Education Level of Parents (Figure 347) ..... 368
By Race/Ethnicity (Figure 348) ..... 369
Any Vaping: Trends in 30-Day Prevalence By Gender (Figure 349) ..... 370
By College Plans (Figure 350) ..... 371
By Region (Figure 351) ..... 372
By Population Density (Figure 352) ..... 373
By Average Education Level of Parents (Figure 353) ..... 374
By Race/Ethnicity (Figure 354) ..... 375

## LIST OF FIGURES (continued)

Vaping Nicotine: Trends in 30-Day Prevalence
By Gender (Figure 355) ..... 376
By College Plans (Figure 356) ..... 377
By Region (Figure 357) ..... 378
By Population Density (Figure 358) ..... 379
By Average Education Level of Parents (Figure 359) ..... 380
By Race/Ethnicity (Figure 360) ..... 381
Vaping Marijuana: Trends in 30-Day Prevalence
By Gender (Figure 361) ..... 382
By College Plans (Figure 362) ..... 383
By Region (Figure 363) ..... 384
By Population Density (Figure 364) ..... 385
By Average Education Level of Parents (Figure 365) ..... 386
By Race/Ethnicity (Figure 366) ..... 387
Vaping Just Flavoring: Trends in 30-Day Prevalence By Gender (Figure 367) ..... 388
By College Plans (Figure 368) ..... 389
By Region (Figure 369) ..... 390
By Population Density (Figure 370) ..... 391
By Average Education Level of Parents (Figure 371) ..... 392
By Race/Ethnicity (Figure 372) ..... 393
Smokeless Tobacco: Trends in 30-Day Prevalence
By Gender (Figure 373) ..... 394
By College Plans (Figure 374) ..... 395
By Region (Figure 375) ..... 396
By Population Density (Figure 376) ..... 397
By Average Education Level of Parents (Figure 377) ..... 398
By Race/Ethnicity (Figure 378) ..... 399
Smokeless Tobacco: Trends in 30-Day Prevalence of Daily Use
By Gender (Figure 379) ..... 400
By College Plans (Figure 380) ..... 401
By Region (Figure 381) ..... 402
By Population Density (Figure 382) ..... 403

## INTRODUCTION

This occasional paper presents national demographic subgroup data for the 1975-2022 Monitoring the Future (MTF) national survey results on $8^{\text {th }}, 10^{\text {th }}$, and $12^{\text {th }}$ graders' use of drugs, alcohol, and tobacco. MTF is funded by the National Institute on Drug Abuse (one of the National Institutes of Health) under a series of investigator-initiated, competitive research grants to the University of Michigan. The study covers all major classes of illicit and licit psychoactive drugs for an array of population subgroups. The 2020 subgroup data presented here accompany the Monitoring the Future National Survey Results on Drug Use: 19752022: Overview, Key Findings on Adolescent Drug Use ${ }^{1}$ and the Monitoring the Future National Survey Results on Drug Use, 1975-2022: Secondary School Students. ${ }^{2}$ Prior to 2014 subgroup data were available in tabular form only in Appendices B and D of the relevant year's volume on secondary school students. ${ }^{3}$ Since 2014, the MTF subgroup definitions and data have been presented in this series of occasional papers, in both tables and figures to facilitate the examination and interpretation of trend data.

The Overview of Key Findings present on one page figures giving trends in (a) prevalence, (b) perceived risk, (c) disapproval, and (d) perceived availability for each drug under study. The larger volume, by Miech et. al, contains a much more extensive description of MTF's design and purposes, as well as extended reporting on substance use of all kinds-licit and illicit-and a number of related factors, such as attitudes and beliefs about drugs, age of initiation, perceived availability, relevant conditions in the social environment, history of daily marijuana use, use of drugs for the treatment of ADHD, and sources of prescription drugs used outside of medical supervision. These volumes are available on the Monitoring the Future website.

The trends offered here in both tabular and graphic forms cover demographic subgroups based on:

- Gender
- College plans
- Region of the country
- Population density
- Education level of the parents (a proxy for socioeconomic level)
- Racial/ethnic identification

The List of Figures above provides a direct link to each figure; and the List of Tables (also above, starting on page 19) has a direct link to each table. Detailed descriptions of the various demographic categories discussed here are provided starting on page 490. The tables section begins on page 495. Approximate weighted Ns for each grade are provided at the end of the Tables section as Tables S-1, S-2, and S-3 for grades 8,10 , and 12 , respectively. They are on pages 848-852.

The graphs and tables in this occasional paper present trend data for $8^{\text {th }}, 10^{\text {th }}$, and $12^{\text {th }}$ grade respondents separately. Data for $12^{\text {th }}$ grade begins with 1975 , the first year in which a nationally representative sample of high school seniors was surveyed. Data for $8^{\text {th }}$ and $10^{\text {th }}$ grades begin with 1991 , when the study's nationally representative annual surveys were expanded to include surveys of those two lower grade levels.

Note. In year 2020 chart data imputed as average of 2019 and 2021 estimates. No 2020 estimates are available because the COVID-19 pandemic curtailed data collection in this year and MTF collected only about one-quarter the number of surveys it collects in a typical year.
*Beginning in 1993, a revised set of questions on alcohol use was introduced that indicated that a drink meant more than a few sips.

Wine:* Trends in 2-Week Prevalence of Having 5 or More Drinks in a Row by Region

Source. The Monitoring the Future study, the University of Michigan.
Note. In year 2020 chart data imputed as average of 2019 and 2021 estimates. No 2020 estimates are available because the COVID-19 pandemic curtailed data collection in this year and MTF collected only about one-quarter the number of surveys it collects in a typical year.
*In the 1988 questionnaires, a question on the use of wine coolers was added. This change may account for the discontinuity between
the 1987 and 1988 use rates for wine.

## DEFINITION OF BACKGROUND AND DEMOGRAPHICSUBGROUPS

The following are brief definitions of the background and demographic subgroups explored in the Monitoring the Future (MTF) national survey of $8^{\text {th }}, 10^{\text {th }}$, and $12^{\text {th }}$ graders' attitudes toward and use of drugs (including alcohol and tobacco). A more thorough discussion of the findings can be found in Appendix B of the MTF monograph on secondary school students ${ }^{4}$ (Note: All case counts provided in the tables here are based on weighted Ns.)

Total: The total sample of respondents in a given year based on weighted cases (set to equal the total number of actual cases).

Gender: Male and female. Respondents are asked, "What is your sex?" Those with missing data on the question are omitted from the data presented by gender.

College $\quad$ Respondents are asked how likely it is that they will graduate from a four-year college Plans: program. College plans groupings are defined as follows:

None or under four years. Respondents who indicate they "definitely won't" or "probably won't" graduate from a four-year college program. (Note that, among those who do not expect to complete a four-year college program, a number still expect to get some postsecondary education.)

Complete four years. Respondents who indicate they "definitely will" or "probably will" graduate from a four-year college program.

Those not answering the college plans question are omitted from both groupings.
Region: Region of the country in which the respondent's school is located. There are four mutually exclusive regions in the US based on Census Bureau categories, defined as follows:

Northeast. Census classifications of New England and Middle Atlantic states consist of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania.

Midwest. Census classifications of East North Central and West North Central states consist of Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas.

South. Census classifications of South Atlantic, East South Central, and West South Central states consist of Delaware, Maryland, District of Columbia, Virginia, and West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas.

West. Census classifications of Mountain and Pacific states consist of Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and

[^1]California (Alaska and Hawaii are also included in this Census region, but are not included in the MTF study).

## Population Density:

Population density of the area in which the schools are located. There are three mutually exclusive groups into which schools have been placed in a given year based on population density. The 1975-1985 samples were based on the 1970 Census; in 1986, one-half of the sample was based on the 1970 Census and the other half was based on the 1980 Census. In 1987 through 1993, all samples were based on the 1980 Census; in 1994, half of the sample was based on the 1980 Census and half on the 1990 Census. Starting in 2006 until 2013, each first-year half-sample of schools comes from a sample design that utilizes 2000 Census counts as the measure of size for first-stage units. Counts from the 2010 Census were used for the samples beginning in 2014.

The three levels of population density were defined in terms of Standard Metropolitan Statistical Area (SMSA) designations through 1985, and then changed to the new Office of Management and Budget (OMB) classifications of Metropolitan Statistical Areas (MSAs). ${ }^{5}$ Except in the New England states, an MSA is a county or group of contiguous counties that contain at least one city of 50,000 inhabitants or more or twin cities with a combined population of at least 50,000. In the New England states, MSAs consisted of towns and cities instead of counties until 1994, after which New England Consolidated Metropolitan Areas (NECMAs) were used to define MSAs. Each MSA must include at least one central city, and the complete title of an MSA identifies the central city or cities. For the complete description of the criteria used in defining MSAs, see the OMB publication, Metropolitan Statistical Areas, 1990 (NTIS-PB90-214420), Washington, D.C. Although MTF has updated the measures of size of the MSAs and non-MSAs following the 2000 and 2010 Censuses, the project has not altered MSA definitions since the introduction of its new sample design in 1994. Thus, MTF continues to utilize the MSAs as defined by OMB in June $1990 .{ }^{6}$ The population living in an MSA is designated as the metropolitan population. The levels of population density used in MTF include those described here:

Large MSA. These were the 12 largest SMSAs as of the 1970 Census and were used for the 1975-1985 samples: New York, Los Angeles, Chicago, Philadelphia, Detroit, San Francisco, Washington, Boston, Pittsburgh, St. Louis, Baltimore, and Cleveland. As of the 1980 Census, the Large MSA group consisted of the 16 largest MSAs in the nation. This new structure was used for the 1986-1994 samples. These 16 MSAs include all of those mentioned above except Cleveland, plus Dallas-Fort Worth, Houston, Nassau-Suffolk, Minneapolis-St. Paul, and Atlanta.

A new sample design was developed based on the 1990 Census, beginning with the first-year half-A sample of schools chosen in 1994. In the 1990s sample, only the eight largest MSAs are represented with certainty at all three grade levels; 16 other large MSAs are divided into pairs, with half randomly assigned to both the $8^{\text {th }}$ and $12^{\text {th }}$ grade samples and the other half assigned to the $10^{\text {th }}$ grade sample. The eight largest MSAs are New York, Los Angeles-Long Beach, Chicago, Philadelphia PA-NJ, Detroit,

[^2]Washington DC-MD-VA, Dallas-Ft. Worth, and Boston-Lawrence-Salem-LowellBrockton. The other 16 large MSAs are Houston, Atlanta, Seattle-Tacoma, Minneapolis-St. Paul MN-WI, St. Louis MO-IL, San Diego, Baltimore, Pittsburgh, Phoenix, Oakland, Cleveland, Miami, Newark, Denver, San Francisco, and Kansas City MO-KS.

Other MSAs. This category consists of all other, smaller MSAs, as defined by OMB, except those listed previously.

Non-MSAs. This category consists of all areas not designated as MSAs-in other words, they do not contain a town (or twin cities) of at least 50,000 inhabitants. The population living outside of MSAs constitutes the nonmetropolitan population.

Parental Education:

This is an average of mother's education and father's education based on the respondents' answers about the highest level of education achieved by each parent, using the following scale: (1) completed grade school or less, (2) some high school, (3) completed high school, (4) some college, (5) completed college, and (6) graduate or professional school after college. Missing data were allowed for one of the two parents. The respondent was instructed, "If you were raised mostly by foster parents, stepparents, or others, answer for them. For example, if you have both a stepfather and a natural father, answer for the one that was most important in raising you." Ethnicity:

Race/ From 1975 through 2004, respondents were asked, "How do you describe yourself?" and were presented with a list of various racial/ethnic categories. A general instruction told them to select the one best response for each question. In 2005, the instructions in half of the questionnaire forms were revised in order to be more consistent with the guidelines of the Office of Management and Budget for assessing race/ethnicity. In the changed forms, respondents were presented with a list of racial/ethnic categories and instructed to "select one or more responses." An examination of the data showed that relatively few respondents (about $6 \%$ in 2005 and about $6.6 \%$ of the sample in 2014) selected more than one racial/ethnic category. Because some survey questions appear in only one or a few forms, there was some variation in the version of the race/ethnicity question upon which the 2005 data were based. Based on the analyses we have examined, we do not believe these different permutations make any appreciable difference in the results. In 2006 and thereafter the revised instruction was used in all forms. Those checking multiple racial/ethnic groups or one of the other specified groups are omitted from the reporting on race/ethnicity in this volume because of the small numbers of cases.

White/Caucasian. Consists of those respondents who describe themselves as White or Caucasian in 1975-2004. In 2005, the unchanged questionnaire forms were treated in a similar manner. For the revised question in 2005 and for all forms in 2006 and beyond, those checking only White and no other racial/ethnic group were categorized as White.

African American. Consists of those respondents who in 1975-1990 describe themselves as Black or Afro-American or who, in 1991-2004, describe themselves as Black or African American. In 2005, the unchanged questionnaire forms were treated in a similar manner; for the revised question in 2005 and for all forms in 2006 and beyond, only those checking Black or African American and no other racial ethnic group were categorized as African American.

Hispanic. Consists of those respondents who in 1975-1990 describe themselves as Mexican American or Chicano, or Puerto Rican or other Latin American. After 1990, this group includes those respondents who describe themselves as Mexican American or Chicano, Cuban American, Puerto Rican American, or other Latin American. (The term "Puerto Rican American" was shortened to "Puerto Rican" after 1994.) In 2005, the unchanged questionnaire forms were treated in a similar manner; the changed forms in 2005 and for all forms in 2006 and beyond, only those checking Mexican American or Chicano, Cuban American, Puerto Rican, or Other Hispanic or Latino and no other racial/ethnic group were categorized as Hispanic.

## TRENDS BY SUBGROUP: SUPPLEMENTAL TABLES FOR SECONDARY SCHOOL STUDENTS

The tables in this section contain the numbers underlying the trend lines shown in the figures on subgroup trends. Trends in subgroup data for the 1975-2022 Monitoring the Future (MTF) results containing $8^{\text {th }}, 10^{\text {th }}$, and $12^{\text {th }}$ graders' use of drugs, tobacco, and alcohol are presented in tables below. The trends observed span major classes of drugs for population subgroups defined by gender, college plans, region, population density, parental education, and race/ethnicity. Appendix C of the main volume on secondary school students contains a portion of the information presented here. ${ }^{7}$

Due to the sheer quantity of information such trend tables generate for each prevalence measure (e.g., lifetime, annual, 30-day, daily), we have selected only the prevalence periods that seem most useful for understanding subgroup differences below. Thus, for most drugs, we include only annual prevalence; rates for additional prevalence periods are provided for alcohol, cigarettes, and smokeless tobacco because of their more frequent use. The numbers of cases that go with the data in the figures may be found in the complete set of tables that are included below.

The subgroups distinguished in these tables are used throughout and are defined in the previous section of this occasional paper. The reader should note that two-year moving averages are given for the three major racial/ethnic groups in order to reduce fluctuations in the trends due to random sampling differences. A footnote in each table describes the procedure used to obtain the presented data. A question about race/ethnicity identification was changed in 2005 in half of the questionnaire forms; allowing respondents to select multiple categories of race/ethnicity rather than just one (see the previous section for more details). In 2006, the remaining questionnaire forms were changed in a like manner. However, we believe that this change has had little effect on the results because so few respondents selected more than one of the categories offered.

For nearly all drugs, we provide one table showing the subgroup trends (since 1991) for $8^{\text {th }}$ graders, a second table of trends (since 1991) for $10^{\text {th }}$ graders and a third table showing the longer term trends (since 1975) for $12^{\text {th }}$ graders. However, for two of the drugs-sedatives (barbiturates) and narcotics other than herointhe $8^{\text {th }}$ and $10^{\text {th }}$ grade data have been omitted, as they have been throughout MTF publications because we are less certain about the validity of the answers provided by those younger students. Specifically, we believe that they often fail to omit nonprescription substances. Usage questions for a few other drugs are simply not asked of $8^{\text {th }}$ and $10^{\text {th }}$ graders; thus, only $12^{\text {th }}$ grade tables are presented.

Sample sizes should be taken into account when interpreting the importance of any changes observed. The numbers provided in the tables assume that all respondents in a given grade were asked about their use of the drug. Some of the drugs were not contained in all questionnaire forms, meaning that the subgroup and total numbers must be adjusted accordingly. The "Notes" section at the bottom of each table will indicate what fraction of the total sample received the question.

This paper also includes graphic presentations of the trends presented in the tables for the various demographic subgroups. These figures use color to help distinguish the various subgroups and to improve readability.

[^3]

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. 'Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table. The 2013 data are based on half the forms;
$N$ is one half of $N$ indicated. Beginning in 2014 data are based on all forms. See the amphetamine notes for details of the changes.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Use of any illicit drug includes any use of marijuana, LSD, other hallucinogens, crack, other cocaine, or heroin; or any use of amphetamines or tranquilizers
not under a doctor's orders. The use of narcotics other than heroin and sedatives (barbiturates) has been excluded because 8 th and 10 th graders appear
to overreport their use (perhaps because they include the use of nonprescription drugs in their answers).
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{d}$ For 8th and 10 th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.
Any illicit drug use and any illicit drug use including inhalants were also impacted by this change.

TABLE 2

Source. The Monitoring the Future study, the University of Michigan
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of
Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See
Table S2 for the number of subgroup cases. See appendix B for definition of variables in table. The 2013 data are based on half the forms; $N$ is
one half of $N$ indicated. Beginning in 2014 data are based on all forms. See the amphetamine notes for details of the changes.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Use of any illicit drug includes any use of marijuana, LSD, other hallucinogens, crack, other cocaine, or heroin; or any use of amphetamines or tranquilizers
not under a doctor's orders. The use of narcotics other than heroin and sedatives (barbiturates) has been excluded because 8th and 10th graders appear
to overreport their use (perhaps because they include the use of nonprescription drugs in their answers).
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {c E Estimates }}$ for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)
"For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, a।
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated
Any illicit drug use and any illicit drug use including inhalants were also impacted by this change.

TABLE 3 (cont.)
ANY ILLICIT DRUG: ${ }^{\text {a,b,e }}$ Trends in Annual Prevalence of Use by Subgroups in Grade 12

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimates and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. The 2013 data are based on half the forms; $N$ is one half of $N$ indicated. Beginning in 2014 data are based on all forms. See the amphetamine notes for details of the changes.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Use of any illicit drug includes any use of marijuana, LSD, other hallucinogens, crack, other cocaine, or heroin; or any use of narcotics other than heroin,
amphetamines, sedatives (barbiturates), methaqualone (excluded since 1990), or tranquilizers not under a doctor's orders
${ }^{\text {b }}$ Beginning in 1982 the question about amphetamine use was revised to get respondents to exclude the inappropriate reporting of nonprescription amphetamines. The prevalence-of-use rate dropped slightly as a result of this methodological change.
${ }^{\text {c }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{J}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\mathrm{e}}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.
Any illicit drug use and any illicit drug use including inhalants were also impacted by this change.

TABLE 4

TABLE 4 (cont.)
ANY ILLICIT DRUG OTHER THAN MARIJUANA: ${ }^{\text {a }}$ Trends in Annual Prevalence of Use
by Subgroups in Grade 8

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 1 for the number of subgroup cases. See appendix $B$ for definition of variables in table. The 2013 data are based on half the forms; $N$ is one half of $N$ indicated. Beginning in 2014 data are based on all forms. See the amphetamine notes for details of the changes.
§ Insufficient data for 2020 estimate.
${ }^{a}$ Use of any illicit drug other than marijuana includes any use of LSD, other hallucinogens, crack, other cocaine, or heroin; or any use of amphetamines or tranquilizers not under a doctor's orders. The use of narcotics other than heroin and sedatives (barbiturates) has been excluded because 8 th and 10 th graders appear to overreport their use (perhaps because they include the use of nonprescription drugs in their answers).
${ }^{\text {}}$ In 2001 the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens, and shrooms was
added to the list of examples. For the tranquilizer list of examples, Miltown was replaced with Xanax. The 2001 data are based on the changed forms only;
N is one half of N indicated. In 2002 the remaining forms were changed. Beginning in 2002 , the data are based on all forms. Data for any illicit drug other
than marijuana and hallucinogens are also affected by these changes and have been treated in a parallel manner.

${ }^{d}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{e}$ Due to changes in the question wording in half of the questionnaire forms in 2001 , the 2002 entry comprises half of the 2001 sample data double-
weighted (the half with the new version of the question) and all of the 2002 sample data

# TABLE 5 (cont.) 

## ANY ILLICIT DRUG OTHER THAN MARIJUANA: ${ }^{\text {a }}$ Trends in Annual Prevalence of Use by Subgroups in Grade 10

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 2 for the number of subgroup cases. See appendix B for definition of variables in table. The 2013 data are based on half the forms; $N$ is one half of $N$ indicated. Beginning in 2014 data are based on all forms. See the amphetamine notes for details of the changes
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Use of any illicit drug other than marijuana includes any use of LSD, other hallucinogens, crack, other cocaine, or heroin; or any use of amphetamines or tranquilizers not under a doctor's orders. The use of narcotics other than heroin and sedatives (barbiturates) has been excluded because 8th and 10th graders appear to overreport their use (perhaps because they include the use of nonprescription drugs in their answers)
${ }^{\text {b }} 2001$ the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens, and shrooms was added to the list of examples. For the tranquilizer list of examples, Miltown was replaced with Xanax. The 2001 data are based on the changed forms only; N is one half of N indicated. In 2002 the remaining forms were changed. Beginning in 2002, the data are based on all forms. Data for any illicit drug other than marijuana and hallucinogens are also affected by these changes and have been treated in a parallel manner.
${ }^{\text {c Parental education is an average score of mother's education and father's education. See appendix B for details }}$
${ }^{d}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). ${ }^{e}$ Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-
weighted (the half with the new version of the question) and all of the 2002 sample data.

# TABLE 6 (cont.) 

ANY ILLICIT DRUG OTHER THAN MARIJUANA: ${ }^{\text {a,b }}$ Trends in Annual Prevalence of Use by Subgroups in Grade 12

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. The 2013 data are based on half the forms; $N$ is one half of $N$ indicated. Beginning in 2014 data are based on all forms. See the amphetamine notes for details of the changes,

## § Insufficient data for 2020 estimate.

${ }^{\text {a }}$ Use of any illicit drug other than marijuana includes any use of LSD, other hallucinogens, crack, other cocaine, or heroin; or any use of narcotics other than heroin,
amphetamines, sedatives (barbiturates), methaqualone (excluded since 1990), or tranquilizers not under a doctor's orders
${ }^{\text {b }}$ Beginning in 1982 the question about amphetamine use was revised to get respondents to exclude the inappropriate reporting of nonprescription amphetamines.
The prevalence-of-use rate dropped slightly as a result of this methodological change.
${ }^{\text {c }}$ Parental education is an average score of mother's education and father's education. See appendix B for details
${ }^{\text {d }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{e}$ In 2001 the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens and shrooms was added to
the list of examples. For the tranquilizer list of examples, Miltown was replaced with Xanax. The 2001 data are based on the changed forms only; N is one half of
$N$ indicated. In 2002 the remaining forms were changed. Beginning in 2002, the data are based on all forms. Data for any illicit drug other than marijuana and
hallucinogens are also affected by these changes and have been treated in a parallel manner.
'Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the half
with the new version of the question) and all of the 2002 sample data.

Source. The Monitoring the Future Study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence-of-use estimates for the two most recent classes is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.

${ }^{6}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\mathrm{c}}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future Study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence-of-use estimates for the two most recent classes is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table.

## § Insufficient data for 2020 estimate.

${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{6}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\text {c }}$ For 8 th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding
See Table S 1 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate
Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding.
See Table S 2 for the number of subgroup cases. See appendix B for definition of variables in table
§ Insufficient data for 2020 estimate
'Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\circ}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

[^4]Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
'Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{5}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)
${ }^{c}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence-of-use estimates for the two most recent classes is due to
rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{c}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future Study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, s s s=.001$. '-' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence-of-use estimates for the two most recent classes is due to rounding See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.

Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{c}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future Study, the University of Michigan
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$.' - ' indicates data not available. ' ' indicates
less than .05 percent but greater than 0 percent. Any apparent inconsistency between the change estimate and the prevalence-of-use estimates
for the two most recent classes is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
PParental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{c}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Source. The Monitoring the Future Study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any
apparent inconsistency between the change estimate and the prevalence-of-use estimates for the two most recent classes is due to rounding
See Table S2 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate
Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{c}$ For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated.

Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. '-' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence-of-use estimates for the two most recent classes is due to rounding. See Table S3
for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)
For 8th and 10th graders only: In 2021, the question on marijuana use was changed in half of the questionnaire forms to include smoking, vaping, and
edibles in the list of examples. Data presented here for 2021 based on the forms that included the original question wording. N is one half of N indicated

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| *Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years. ${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {an }}$ Parental education is an average score of mother's education and father's education. See appendix B for details,
${ }^{6}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
Beginning in 2014 data are based on three of four forms; $N$ is two thirds of $N$ indicated

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on four of five forms in 1976-1988; $N$ is four fifths of $N$ indicated in Table S3. Data based on five of six forms in 1989-1998; N is five sixths of N indicated in Table S3. Data based on three of six forms beginning in 1999; N is three sixths of N indicated in Table S 3 .
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ All data are unadjusted for underreporting of amyl and butyl nitrites, except where otherwise noted
${ }^{\mathrm{b}}$ Adjusted for underreporting of amyl and butyl nitrites. See text for details.
${ }^{\text {c }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). and thus provide more stable estimates. See appendix B for details on how race/ethnicity is defined.

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between
the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
In 2001 the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens, and shrooms was added to the
ist of examples. The 2001 data are based on the changed forms only; N is one half of N indicated. In 2002 the remaining forms were changed. Beginning in 2002, the
data are based on all forms. Data for any illicit drug other than marijuana and hallucinogens are also affected by these changes and have been treated in a parallel manner.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.

hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\mathrm{d}}$ Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the half with
the new version of the question) and all of the 2002 sample data.

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. Se
appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
All data are unadjusted for the underreporting of PCP, unless otherwise indicated.
${ }^{\text {b }}$ Adjusted for the underreporting of PCP. See text for details.
'Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)
In 2001 the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens, and shrooms was added to the lis
of examples. The 2001 data are based on the changed forms only; N is one half of N indicated. In 2002 the remaining forms were changed. Beginning in 2002, the data
are based on all forms. Data for any illicit drug other than marijuana and hallucinogens are also affected by these changes and have been treated in a parallel manner.
Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the half with
the new version of the question) and all of the 2002 sample data.
In 2014 questions on use of LSD and hallucinogens other than LSD, the two components of hallucinogen use, were each dropped from one of six forms. Beginning in
2014 data are based on five of six forms; N is five sixths of N indcated.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix B for definition of variables in table
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{a}$ Parental education is an average score of mother's education and father's education. See appendix B for details,
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{9}$ In 2014 questions on use of LSD were dropped from one of six forms. Beginning in 2014 data are based on five of six forms; $N$ is five sixths of $N$ indcated.

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' $^{\prime}-$ ' indicates data not available. Any apparent inconsistency between
the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 2001 the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens, and shrooms was added to the
list of examples. The 2001 data are based on the changed forms only; N is one half of N indicated. In 2002 have been the remaining forms were changed. Beginning
in 2002, the data are based on all forms. Data for any illicit drug other than marijuana and hallucinogens are also affected by these changes and treated in a
parallel manner.
${ }^{6}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
 that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\text {d }}$ Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the half
with the new version of the question) and all of the 2002 sample data.

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. '-' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 2001 the question text was changed on half of the questionnaire forms. Other psychedelics was changed to other hallucinogens, and shrooms was added to the list
ex examples. The 2001 data are based on the changed forms only; $N$ is one half of $N$ indicated. In 2002 the remaining forms were changed. Beginning in 2002, the dat
are based on all forms. Data for any illicit drug other than marijuana and hallucinogens are also affected by these changes and have been treated in a parallel manner.
Parental education is an average score of mother's education and father's education. See appendix B for details.

at are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the half with
the new version of the question) and all of the 2002 sample data

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 2 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in 1996; $N$ is one half of $N$ indicated in Table S2. Data based on one of four forms in 1997-2001; $N$ is one third of $N$ indicated in Table S2. Data based on two of four forms beginning in 2002; $N$ is one half of $N$ indicated in Table S2. In 2014 a revised question on use of ecstasy (MDMA) including "Molly" was added to one form Beginning in 2014 data reported here are for the revised wording which includes "Molly"; $N$ is two sixths of $N$ indicated in 2014 and five sixths of $N$ indicated beginning in 2015.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. Two year race
data for the 2014 are based on the 2013 and 2014 unchanged forms only. Two year race data for the 2015 are based on the 2014 revised wording data two and one half times weighted and the 2015 revised
wording data. Beginning in 2016 two year race data based only on revised wording data. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in 1996; $N$ is one half of $N$ indicated in Table S2. Data based on one of four forms in 1997-2001; $N$ is one third of $N$ indicated in Table S2. Data based on two of four forms beginning in 2002; $N$ is one half of $N$ indicated in Table S2. In 2014 a revised question on use of ecstasy (MDMA) including "Molly" was added to one form.
Beginning in 2014 data reported here are for the revised wording which includes "Molly"; $N$ is two sixths of $N$ indicated in 2014 and five sixths of $N$ indicated beginning in 2015.
$\S$ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. Two year race
data for the 2014 are based on the 2013 and 2014 unchanged forms only. Two year race data for the 2015 are based on the 2014 revised wording data two and one half times weighted and the 2015 revised
wording data. Beginning in 2016 two year race data based only on revised wording data. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size
of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of six forms in 1996-2001; $N$ is one sixth of $N$ indicated in Table S 3 . Data based on two of six forms beginning in 2002; $N$ is two sixths of $N$ indicated in Table S3. Beginning in 2014 a revised question on use of ecstasy (MDMA) including "Molly" was added to one form. Beginning in 2014 data reported here are for the revised wording which includes "Molly". $N$ is one sixth of N indicated in 2014 and three sixths of $N$ indicated beginning in 2015.

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

## § Insufficient data for 2020 estimate

${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. Two year race
data for the 2014 are based on the 2013 and 2014 unchanged forms only. Two year race data for the 2015 are based on the 2014 revised wording data triple weighted and the 2015 revised
wording data. Beginning in 2016 two year race data based only on revised wording data. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
Parental education is an average score of mother's education and father's education. See appendix B for details,
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{a}$ Parental education is an average score of mother's education and father's education. See appendix B for details
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

## TABLE 43 (cont.)

CRACK: Trends in Annual Prevalence of Use by Subgroups in Grade 8

source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate
Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of five forms in $1986 ; N$ is one fifth of $N$ indicated in Table S3. Data based on two forms in 1987-1989; $N$ is two fifths of $N$ indicated in 1987-1988 and two sixths of $N$ indicated in 1989 in Table S3. Data based on six forms beginnning in 1990.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. See appendix B for definition of variables in table. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one form in 1987-1989; $N$ is one fifth of $N$ indicated in 1987-1988 and one sixth of $N$ indicated in 1989 in Table S3. Data based on four of six forms beginning in 1990; $N$ is four sixths of $N$ indicated in Table S3.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
S Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 1995, the heroin question was changed in half of the forms. Separate questions were asked for use with and without injection. In 1996, the remaining forms
were changed. Data presented here represent the combined data from all forms. Beginning in 2015 Heroin use with and without a needle were dropped in
one form; data based on three of four forms; N is two thirds of N indicated
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 1995, the heroin question was changed in half of the forms. Separate questions were asked for use with and without injection. In 1996, the remaining forms
were changed. Data presented here represent the combined data from all forms. Beginning in 2015 Heroin use with and without a needle were dropped in
one form; data based on three of four forms; N is two thirds of N indicated
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.

${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{c}$ In 1995 , the heroin question was changed in half of the forms. Separate questions were asked for use with and without injection. In 1996, the remaining forms
were changed. Data presented here represent the combined data from all forms.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the
number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in 1995; $N$ is one half of $N$ indicated
in Table S2. Data based on all forms beginning in 1996. Beginning in 2015 Heroin use with and without a needle were dropped in one form; data based
on three of four forms; $N$ is two thirds of $N$ indicated.
§ Insufficient data for 2020 estimate.
*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

## TABLE 55 (cont.)

## HEROIN WITHOUT A NEEDLE: Trends in Annual Prevalence of Use by Subgroups in Grade 8

Percentage who used in last 12 month

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for th
number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on one of two forms in $1995 ; N$ is one half of $N$ indicated
in Table S1. Data based on all forms beginning in 1996. Beginning in 2015 Heroin use with and without a needle were dropped in one form; data based on three of four forms; $N$ is two thirds of $N$ indicated.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix $B$ for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number
of subgroup cases. See appendix B for definition of variables in table. Data based on three of six forms; $N$ is three sixths of $N$ indicated in Table S 3 .
§ Insufficient data for 2020 estimate.
${ }^{\text {Pa }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
Only drug use not under a doctor's orders is included here.
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {E E Estimates }}$ for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
In 2002 the question text was changed in half of the questionnaire forms. In the list of examples of narcotics other than heroin, Talwin, laudanum, and paregoric
were replaced with Vicodin, OxyContin, and Percocet. The 2002 data presented here are based on the changed forms only; N is one half of N indicated. In 2003 the remaining forms were changed to the new wording. Beginning in 2003, the data are based on all forms.
In 2007, in the list of narcotics other than heroin, Dilaudid was replaced with Ultram.
The 2003 data comprise half of the 2002 sample data double-weighted and all of the 2003 sample data.
In 2013 the list of examples was changed on one form: MS Contin, Roxycodone, Hydrocodone (Lortab, Lorcet, Norco), Suboxone, Tylox, and Tramadol were added
to the list. An examination of the data did not show any effect from the wording change.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition o variables in table. Data based on one of four forms; $N$ is one third of $N$ indicated in Table S1.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
a'Only drug use not under a doctor's orders is included here.
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{c}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change
estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 3 for the number of subgroup cases. See appendix B for definition of variables in table.
Data based on two of six forms in 2002-2005; $N$ is two sixths of $N$ indicated in Table S3. Data based on three of six forms beginning in 2006; $N$ is three sixths of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trend .
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\mathrm{b}}$ Parental education is an average score of mother's education and father's education. See appendix B for details
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

TABLE 65 (cont.)

## AMPHETAMINES: ${ }^{\text {a }}$ Trends in Annual Prevalence of Use by Subgroups in Grade 8

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table. In 2009, the question text was changed slightly in half of the questionnaire forms. An examination of the data did not show any effect from the wording changes. In 2010 the remaining forms were changed in a like manner. In 2013 the question wording was changed two of the 8th and 10th grade questionnaires. The new wording in 2013 asked "On how many occasions (if any) have you taken amphetamines or other prescription stimulant drugs..." In contrast, the old wording did not include "or other prescription stimulant drugs." Results in 2013 indicated higher prevalence in questionnaires with the new as compared to the old wording; it was proportionally $61 \%$ higher in 8 th grade and $34 \%$ higher in 10 th grade. 2013 data are based on the changed forms only; $N$ is one half of $N$ indicated.Beginning in 2014 all questionnaires included the new, updated wording.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\mathrm{b}}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ To derive percentages for each racial subgroup, data for the specified year and the previous year have been combined to increase subgroup sample sizes and thus provide more stable estimates. See appendix $B$ for details on how race/ethnicity is defined. 2013 race/ethnicity data are based on the 2012 data combined with the 2013 data from the unchanged forms which were double weighted. The 2014 race/ethnicity data are based on the 2013 changed data which were double weighted and the 2014 data. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

# TABLE 66 (cont.) 

## AMPHETAMINES: ${ }^{\text {a }}$ Trends in Annual Prevalence of Use by Subgroups in Grade 10

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, sss $=.001$. ' - ' indicates data ' not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 2 for the number of subgroup cases. See appendix B for definition of variables in table. In 2009, the question text was changed slightly in half of the questionnaire forms. An examination of the data did not show any effect from the wording changes. In 2010 the remaining forms were changed in a like manner. In 2013 the question wording was changed two of the 8th and 10th grade questionnaires. The new wording in 2013 asked "On how many occasions (if any) have you taken amphetamines or other prescription stimulant drugs...." In contrast, the old wording did not include "or other prescription stimulant drugs." Results in 2013 indicated higher prevalence in questionnaires with the new as compared to the old wording; it was proportionally $61 \%$ higher in 8 th grade and $34 \%$ higher in 10 th grade. 2013 data are based on the changed forms only; $N$ is one half of $N$ indicated. Beginning in 2014 all questionnaires included the new, updated wording
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {c }}$ To derive percentages for each racial subgroup, data for the specified year and the previous year have been combined to increase subgroup sample sizes and thus provide more stable estimates. See appendix B for details on how race/ethnicity is defined. 2013 race/ethnicity data are based on the 2012 data combined with the 2013 data from the unchanged forms which were double weighted. The 2014 race/ethnicity data are based on the 2013 changed data which were double weighted and the 2014 data. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

## TABLE 67 (cont.)

## AMPHETAMINES: ${ }^{\text {a,b }}$ Trends in Annual Prevalence of Use by Subgroups in Grade 12

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $s=.05$, $\mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. In 2013 the question wording was changed slightly in four of the six questionnaire forms. Vyvanse was added to the list of examples in one questionnaire form. 2013 data presented here are based on the unchanged forms only; $N$ is two sixths of $N$ indicated.
§ Insufficient data for 2020 estimate.
Only drug use not under a doctor's orders is included here.
${ }^{5}$ Beginning in 1982, the question about amphetamine use was revised to get respondents to exclude the inappropriate reporting of nonprescription amphetamines. The prevalence rate dropped slightly as a result of this methodological change. (In 1982 and 1983, the data are based on three of the five questionnaire forms.) Only drug use not under a doctor's orders is included here. In 2009, the question text was changed slightly in half of the questionnaire forms. An examination of the data did not show any effect from the wording changes. In 2010 the remaining forms were changed in a like manner. In 2011 bennies, Benzedrine, and Methadrine were deleted from the list of examples in one questionnaire form. An examination of the data did not show any effect from the wording changes. In 2013 the question wording was changed in three of the 12th grade questionnaires. The new wording in 2013 asked "On how many occasions (if any) have you taken amphetamines or other prescription stimulant drugs..." In contrast, the old wording did not include "or other prescription stimulant drugs." Results in 2013 indicated higher prevalence in questionnaires with the new as compared to the old wording; it was proportionally $21 \%$ higher in 12 th grade. 2013 data are based on the changed forms only; N is one half of N indicated. Beginning in 2014 all questionnaires included the new, updated wording.
'Parental education is an average score of mother's education and father's education. See appendix B for details.
'To derive percentages for each racial subgroup, data for the specified year and the previous year have been combined to increase subgroup sample sizes and thus provide more stable estimates. See appendix B for details on how race/ethnicity is defined. 2013 race/ethnicity data are based on the 2012 data combined with the 2013 data from the unchanged forms which were tripleweighted. The 2014 race/ethnicity data are based on the 2013 changed data which were double weighted and the 2014 data. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table $S 3$ for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

## TABLE 77

METHAMPHETAMINE: Trends in Annual Prevalence of Use by Subgroups in Grade 12

TABLE 78
CRYSTAL METHAMPHETAMINE (ICE): Trends in Annual Prevalence of Use by Subgroups in Grade 12

Source. The Monitoring the Future study, the University of Michigan.
Notes. - - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence
estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases See appendix B for definition of variables in table. Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3.

Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends

${ }^{5}$ To derive percentages for each racial subgroup, data for the specified year and the previous year have been combined to increase subgroup sample sizes and thus provide more stable estimates. See appendix B for details on how race/ethnicity is defined.

| Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ In 2004 the barbiturate question text was changed on half of the questionnaire forms. Barbiturates was changed to Sedatives, including barbiturates, and |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| "have you taken barbiturates . . " was changed to "have you taken sedatives ..." In the list of examples downs, downers, goofballs, yellow, reds, blues, rainbows were changed to downs, or downers, and include Phenobarbital, Tuinal, Nembutal, and Seconal. An examination of the data did not show any effect from the wording change. In 2005 the remaining forms were changed in a like manner. <br>  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\mathrm{e}}$ In 2013 the question text was changed in all forms: Tuinal, Nembutal, and Seconal were replaced with Ambien, Lunesta, and Sonata. In one form the list of examples was also changed: Tuinal was dropped from the list and Dalmane, Restoril, Halcion, Intermezzo, and Zolpimist were added. An examination of the data did not show any effect from the wording changes. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See
ppendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\text {b }}$ In 2001, for the tranquilizer list of examples, Miltown was replaced with Xanax. The 2001 data are based on the changed forms only; $N$ is one half of $N$ indicated
In 2002 the remaining forms were changed. Beginning in 2002, the data are based on all forms. Data for any illicit drug other than marijuana and hallucinogens
are also affected by these changes and have been treated in a parallel manner.
arental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {d Estimates for raciallethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In } 2021 \text { the data are combined with } 2020 \text { data }}$ that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)
${ }^{\text {e }}$ Due to changes in the question wording in half of the questionnaire forms in 2001 , the 2002 entry comprises half of the 2001 sample data double-weighted (the
half with the new version of the question) and all of the 2002 sample data

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. See
appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\text {b }}$ In 2001, for the tranquilizer list of examples, Miltown was replaced with Xanax. The 2001 data are based on the changed forms only; $N$ is one half of $N$ indicated.
In 2002 the remaining forms were changed. Beginning in 2002, the data are based on all forms. Data for any illicit drug other than marijuana and hallucinogens
are also affected by these changes and have been treated in a parallel manner.

 that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\text {e }}$ Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the
half with the new version of the question) and all of the 2002 sample data.

| Source. The Monitoring the Future study, the University of Michigan. <br> Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). ${ }^{d}$ In 2001, for the tranquilizer list of examples, Miltown was replaced with Xanax. The 2001 data are based on the changed forms only; $N$ is one half of $N$ indicated. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| In 2002 the remaining forms were changed. Beginning in 2002, the data are based on all forms. Data for any illicit drug other than marijuana and hallucinogens are also affected by these changes and have been treated in a parallel manner. <br> ${ }^{\mathrm{e}}$ In 2007, for the list of tranquilizers, Equanil and meprobamate were replaced with Soma while Atarax, Tranxene, and Vistaril were replaced with Ativan and Klonopin. f Due to changes in the question wording in half of the questionnaire forms in 2001, the 2002 entry comprises half of the 2001 sample data double-weighted (the half with the new version of the question) and all of the 2002 sample data. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. " ' ' indicates data not available. Any $^{\prime}$ apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table D-S3 for the number of subgroup cases. See appendix B for definition of variables in table. ' $\ddagger$ ' indicates that the question changed the following year.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ The use of any prescription drug includes use of any of the following: amphetamines, sedatives (barbiturates), narcotics other than heroin, or tranquilizers
without a doctor telling you to use them. In 2013 the question wording for amphetamines was changed in three of the 12th grade questionnaires. 2013 data
are based on the three changed forms only. N is three sixths of N indicated. Data for any prescription drug use are affected by these changes and have been
handled in a parallel manner.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education reported on the following scale: (1) Completed grade school or less,
(2) Some high school, (3) Completed high school, (4) Some college, (5) Completed college, (6) Graduate or professional school after college. Missing data
were allowed on one of the two variables.
${ }^{c}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 1 for the number
of subgroup cases. See appendix B for definition of variables in table. Data based on one of four forms; $N$ is one third of $N$ indicated in Table S1.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).
${ }^{\circ}$ Taken to get high

 inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data are based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{5}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection)
${ }^{\text {© }}$ Taken to get high.

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of
significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for
the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of six forms in 1996-2001; $N$ is one sixth
of $N$ indicated in Table S3. Data based on two of six forms beginning in 2002; $N$ is two sixths of $N$ indicated in Table S3. Data based on one
of six forms beginning in 2010; $N$ is one sixth of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ The 2001 and 2002 data are not comparable due to changes in the questionnaire forms.
${ }^{\mathrm{b}}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any 'apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table.
$\S$ Insufficient data for 2020 estimate.
aln 1993, the question text was changed slightly in one form to indicate that a drink meant more than a few sips. The 1993 data are based on the changed form only;
N is one half of N indicated. In 1994 the question text was changed in the remaining form. Beginning in 1994, the data are based on all forms. In 2004, the question
text was changed slightly in half of the forms. An examination of the data did not show any effect from the wording change. The remaining forms were changed in 2005 .
${ }^{\mathrm{b}}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 3 for the number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 1993, the question text was changed slightly in one form to indicate that a drink meant more than a few sips. The 1993 data are based on the changed form only;
N is one half of N indicated. In 1994 the question text was changed in the remaining form. Beginning in 1994, the data are based on all forms. In 2004, the question
text was changed slightly in half of the forms. An examination of the data did not show any effect from the wording change. The remaining forms were changed in 2005.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. 'Any apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See
appendix B for definition of variables in table.
Insufficient data for 2020 estimate.
In 1993, the question text was changed slightly in one form to indicate that a drink meant more than a few sips. The 1993 data are based on the changed form only;
is one half of N indicated. In 1994 the question text was changed in the remaining form. Beginning in 1994, the data are based on all forms. In 2004, the question
ext was changed slightly in half of the forms. An examination of the data did not show any effect from the wording change. The remaining forms were changed in 2005.
Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the hange estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. Se appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 1993 , the question text was changed slightly in one form to indicate that a drink meant more than a few sips. The 1993 data are based on the changed form only
N is one half of N indicated. In 1994 the question text was changed in the remaining form. Beginning in 1994, the data are based on all forms. In 2004, the question
text was changed slightly in half of the forms. An examination of the data did not show any effect from the wording change. The remaining forms were changed in 2005.
"Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data the .

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' $\ddagger$ ' indicates some change in the question. See relevant footnote. See relevant figure to assess the impact of the wording changes. Level of significance
of difference between the two most recent classes: $s=.05, s s=.01, s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the
change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ In 1993, the question text was changed slightly in one form to indicate that a drink meant more than a few sips. The 1993 data are based on the changed form only;
N is one half of N indicated. In 1994 the question text was changed in the remaining form. Beginning in 1994, the data are based on all forms. In 2004, the question
text was changed slightly in half of the forms. An examination of the data did not show any effect from the wording change. The remaining forms were changed in 2005.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the number of subgroup cases. See appendix $B$ for definition of variables in table. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| *Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan
Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

Source. The Monitoring the Future study, the University of Michigan.
Notes. '-' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding.
See Tables $\mathrm{S} 1, \mathrm{~S} 2$, and S 3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of four forms; N is one third of $N$ indicated in S 1 and S 2 .
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
${ }^{a}$ Parental education is an average score of mother's education and father's education. See appendix B for details
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ${ }^{\prime}-$ ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on one of two forms in 1991-1996; $N$ is one half of $N$ indicated in Table S1. Data based on one of four forms beginning in 1997; $N$ is one third of $N$ indicated in Table S1.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
Parental education is an average score of mother's education and father's education. See appendix $B$ for details,
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the
number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on one of two forms in 1991-1996; $N$ is one half of $N$ ndicated in Table S2. Data based on one of four forms beginning in 1997; $N$ is one third of $N$ indicated in Table S2.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
Parental education is an average score of mother's education and father's education. See appendix $B$ for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

## TABLE 109

BEER: Trends in 30-Day Prevalence of Use by Subgroups in Grade 12

|  | Percentage who used in last 30 days |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on one of two forms in 1991-1996; $N$ is one half of $N$ indicated in Table S1. Data based on one of four forms beginning in 1997; $N$ is one third of $N$ indicated in Table S1.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details,
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

| Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 2 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in 1991-1996; $N$ is one half of $N$ indicated in Table S2. Data based on one of four forms beginning in 1997; $N$ is one third of $N$ indicated in Table S2. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01$, $s s s=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of five forms in 1976-1988; $N$ is one fifth of $N$ indicated in Table S3. Data based on one of six forms beginning in 1989; $N$ is one sixth of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {ap }}$ Parental education is an average score of mother's education and father's education. See appendix B for details. <br> ${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of five forms in 1976-1988; $N$ is one fifth of $N$ indica in Table S3. Data based on one of six forms beginning in 1989; $N$ is one sixth of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of five forms in 1976-1988; $N$ is one fifth of $N$ indicated in Table S3. Data based on one of six forms beginning in 1989; $N$ is one sixth of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $\S$ Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any appare inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one five forms in 1976-1988; $N$ is one fifth of $N$ indicated in Table S3. Data based on one of six forms beginning in 1989; $N$ is one sixth of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {a }}$ In the 1988 questionnaires, a question on the use of wine coolers was added. This change may account for the discontinuity between the 1987 and 1988 use rates for wine. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

| Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - 'indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of five forms in 1988; $N$ is one fifth of $N$ indicated in Table S3. Data based on one of six forms beginning in 1989; $N$ is one sixth of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency
between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 1 for the number of subgroup cases.
See appendix B for definition of variables in table. Data based on one of four forms; $N$ is one third of $N$ indicated in Table S1. In 2011 Skyy Blue and Zima were deleted from the list of examples.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Notes. Level of significance of difference between the two most recent classes: $s=.05, s s=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3. In 2011 Skyy Blue and Zima were deleted from the list of examples.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{6}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

TABLE 124
ALCOHOLIC BEVERAGES CONTAINING CAFFEINE:

## Trends in Annual Prevalence of Use by Subgroups in Grade 8

In 2012 the question text was changed from "....had an alcoholic beverage containing caffeine (like Four Loko or Joose)" to "...had an alcoholic beverage mixed with an energy drink (like Red Bull)." The data in 2011 and 2012 are not comparable due to this question change. Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. <br> ${ }^{\text {a P Parental }}$ education is an average score of mother's education and father's education. See appendix B for details. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
Insufficient data for 2020 estimate.
${ }^{3}$ Parental education is an average score of mother's education and father's education. See appendix $B$ for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$.' - ' indicates data not available. Any appare
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 2 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.

## $S$ Insufficient data for 2020 estimate.

${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix B for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate
'Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix $B$ for definition of variables in table. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S 2 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
${ }^{a}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. See appendix $B$ for definition of variables in table.
§ Insufficient data for 2020 estimate.
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding.
ee Tables $\mathrm{S} 1, \mathrm{~S} 2$, and S 3 for the number of subgroup cases. See appendix B for definition of variables in table. For 8 th and 10th graders only: Data based on two of four forms; $N$ is one third of $N$ indicated in S 1 and S2. For 12th graders only: Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3.

## Caution: Limita sate

§ Insufficient data for 2020 estimate
${ }^{2}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

Large Cigars: Trends in 30-Day

## Prevalence of Use by Subgroups in Grades 8, 10, and 12

$\begin{array}{lllllllllll}\text { Hispanic } & - & - & 5.0 & 4.7 & 3.5 & 3.2 & 4.1 & 8 & 0.6 & 1.0 \\ \text { Source. } & \text { The Monitoring the Future study, the University of Michigan. } \\ \text { Notes. } & \text { ' }- \text { ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. }\end{array}$ See Tables S1, S2, and S3 for the number of subgroup cases. See appendix B for definition of variables in table. For 8th and 10 th graders only: Data based on two of four forms; $N$ is one third of $N$ indicated in S 1 and S2. For 12th graders only: Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S 3 .
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate
Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding.
$\ddagger$ ' indicates some change in the question. Se relevant footnote for that drug. See relevant figures to assess the impact of the change.
See Tables $\mathrm{S} 1, \mathrm{~S} 2$, and S 3 for the number of subgroup cases. See appendix B for definition of variables in table. For 8th and 10 th graders only: Data based on one of
four forms; $N$ is one third of $N$ indicated in S 1 and S 2 until 2019. In 2019, N is two thirds of N indicated.. For 12th graders only: Data based on two of six forms until 2019; $N$ is two sixths of $N$ indicated in Table S3.
In 2019, N is two thirds of N indicated. Beginniung in 2020, all estimates for 8th, 10 th, and 12 th graders based on all forms.
In 2017, the surveys switched from asking about vaping in general to asking separately about vaping nicotine, marijuana, and just flavoring. Beginning in 2017, data presented for any vaping
are based on these new questions. The 2017 results by race/ethnicity are based on data from the old version of the question in 2016 combined with the new version in 2017 .

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

$\S$ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
I 2017, the surveys switched from asking about vaping in general to asking separately about vaping nicotine, marijuana, and just flavoring. Beginning in 2017, data presented for any vaping are based on these new questions.

Source. The Monitoring the Future study, the University of Michigan.
Notes. '- ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding
See Tables S 1 , S2, and S 3 for the number of subgroup cases. See appendix B for definition of variables in table. For 8 th and 10 th graders only: Data based on one of
four forms; $N$ is one third of $N$ indicated in S 1 and S 2 until 2019. In 2019, N is two thirds of N indicated.. For 12th graders only: Data based on two of six forms until 2019; $N$ is two sixths of $N$ indicated in Table S 3 . In 2019, N is two thirds of N indicated. Beginniung in 2020, all estimates for 8 th, 10 th, and 12 th graders based on all forms.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
Insufficient data for 2020 estimate.
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{5}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in 1991-1996 and on two of four forms beginning in 1997; $N$ is one half of $N$ indicated in Table S1. In 2011 snus and dissolvable tobacco were added to the list of examples. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| *Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the
number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in 1991-1996 and on two of four forms
beginning in 1997; $N$ is one half of $N$ indicated in Table S2. In 2011 snus and dissolvable tobacco were added to the list of examples.
§ Insufficient data for 2020 estimate.
*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years.
${ }^{a}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3. In 2011 snus and dissolvable tobacco were added to the list of examples

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends

§ Insufficient data for 2020 estimate.
Prevalence of smokeless tobacco use was not asked of 12 th graders in 1990 and 1991. Prior to 1990 the prevalence-of-use question on smokeless tobacco was located near the end of one 12th-grade questionnaire form, whereas after 1991 the question was placed earlier and in a different form. This shift could explain the discontinuities between the corresponding data
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{c}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

## TABLE 148

SMOKELESS TOBACCO: Trends in 30-Day Prevalence of Daily Use by Subgroups in Grade 8

## Source. The Monitoring the Future study, the University of Michigan

Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. ' *' indicates less
han $0.05 \%$ but greater than $0 \%$. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years
is due to rounding. See Table S2 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of two forms in
1991-1996 and on two of four forms beginning in 1997; $N$ is one half of $N$ indicated in Table $S 2$.
$\S$ Insufficient data for 2020 estimate.
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data hat are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence
estimates for the two most recent years is due to rounding. See Table $\mathbf{S 1}$ for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of four forms; $N$ is one third of $N$ indicated in S1.

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

§ Insufficient data for 2020 estimate.
'Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates
for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3.

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. - - 'indicates data not available. Any apparent inconsistency between the change estimate and the
prevalence estimates for the two most recent years is due to rounding. See Table S 3 for the number of
subgroup cases. See appendix $B$ for definition of variables in table. Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

## § Insufficient data for 2020 estimate

${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix $B$ for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S1 for the
number of subgroup cases. See appendix B for definition of variables in table. In 2006 the question text was changed slightly in half of the questionnaire forms. An examination of the data did not show any effect from the wording change. In 2007 the remaining forms were changed in a like manner. In 2008 the question text was changed slightly in half of the questionnaire forms. An examination of the data did not show any effect from the wording change. In 2009 the remaining forms were changed in a like manner
§ Insufficient data for 2020 estimate.
${ }^{\text {a }}$ Only drug use not under a doctor's orders is included here.
${ }^{\text {b }}$ Parental education is an average score of mother's education and father's education. See appendix B for details
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S2 for the
number of subgroup cases. See appendix B for definition of variables in table. In 2006 the question text was changed slightly in half of the questionnaire
orms. An examination of the data did not show any effect from the wording change. In 2007 the remaining forms were changed in a like manner. In 200
the question text was changed slightly in half of the questionnaire forms. An examination of the data did not show any effect from the wording change,
2009 the remaining forms were changed in a like manner.
Insufficient data for 2020 estimate
Only drug use not under a doctor's orders is included here
Parental education is an average score of mother's education and father's education. See appendix B for details.
Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data based on one of six forms in 1989-1990; $N$ is one sixth of $N$ indicated in Table S3. Data based on two of six forms in 1991-2005; $N$ is two sixths of $N$ indicated in Table S3. Data based on three of six forms beginning in 2006; $N$ is three sixths of $N$ indicated in Table S3. In 2006 there were no changes in the two forms containing the original version of the question text. A slightly altered version of the question was added to a third form. An examination of the data did not show any effect from the wording change. In 2007 the forms containing the original version were changed in a like manner. In 2008 the question wording was changed slightly in two of the questionnaire forms. An examination of the data did not show any effect from the wording changes. In 2009 the remaining form was changed in a like manner.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years.
a'Only drug use not under a doctor's orders is included here.
${ }^{\mathrm{b}}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3. See appendix B for definition of variables in table.

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

§ Insufficient data for 2020 estimate.
*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{\mathrm{d}}$ Total prevalence includes respondents who are missing data on some subgroups, and thus may appear inconsistent with subgroup prevalence values.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparen
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S 3 . See appendix B for definition of variables in table

## Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

§ Insufficient data for 2020 estimate.
*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years
'Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{5}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

| Source. The Monitoring the Future study, the University of Michigan. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01$, $\mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. Data based on one of six forms; N is one sixth of N indicated in Table S3. See appendix B for definition of variables in table. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. See appendix $B$ for definition of variables in table. Data are based on one of four forms; $N$ is one third of $N$ indicated in Table S3
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details,
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for definition of variables in table. Data are based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate
${ }^{\text {a }}$ Parental education is an average score of mother's education and father's education. See appendix B for details,
${ }^{6}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
Data from one of the questionnaire forms was omitted in 2005 due to an error in the skip pattern in the questionnaire. For the 2006 results by race/ethnicity, data from the remaining
form in 2005 were double-weighted to account for the omission of the other form.

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' $-{ }^{\prime}$ ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data are based on one of four forms; $N$ is one third of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends
§ Insufficient data for 2020 estimate
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection)

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $s=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent
inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the
number of subgroup cases. See appendix $B$ for definition of variables in table. Data are based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.

## § Insufficient data for 2020 estimate

*Changes across the 2019-2021 total samples provided here for comparison with subgroup changes for the same years.
${ }^{\text {ap }}$ Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).
${ }^{c}$ Data from one of the questionnaire forms was omitted in 2005 due to an error in the skip pattern in the questionnaire. For the 2006 results by race/ethnicity, data from the remaining
form in 2005 were double-weighted to account for the omission of the other form.

Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate

${ }^{\text {b }}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. Level of significance of difference between the two most recent classes: $\mathrm{s}=.05, \mathrm{ss}=.01, \mathrm{sss}=.001$. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix $B$ for definition of variables in table. Data are based on one of four forms; $N$ is one third of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate
Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

[^7]four forms; $N$ is one third of $N$ indicated in S 1 and S2. For 12th graders only: Data based on two of six forms; $N$ is two sixths of $N$ indicated in Table S3.

## 

## Insufficient data for 2020 estimate,

Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data are combined with 2020 data
that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates
for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for
definition of variables in table. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.

${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

Source. The Monitoring the Future study, the University of Michigan.
Notes. $\quad-$ ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates
for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for
definition of variables in table. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3.
Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.
'Parental education is an average score of mother's education and father's education. See appendix B for details.
${ }^{\circ}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

> Source. The Monitoring the Future study, the University of Michigan.
> Notes. ' - ' indicates data not available. Any apparent inconsistency between the change estimate and the prevalence estimates
> for the two most recent years is due to rounding. See Table S3 for the number of subgroup cases. See appendix B for
> definition of variables in table. Data based on one of six forms; $N$ is one sixth of $N$ indicated in Table S3.

Caution: Limited sample sizes (see Notes above). Use caution in interpreting subgroup trends.
§ Insufficient data for 2020 estimate.

${ }^{\mathrm{b}}$ Estimates for racial/ethnic subgroups combine data from current year with data from previous year to augment sample sizes and produce more reliable estimates. In 2021 the data
are combined with 2020 data that are upweighted so that the two years have equal influence on the results (in 2020 MTF collected only about $25 \%$ the size of its usual sample
because of pandemic-curtailed data collection).

| Source. The Monitoring the Future study, the University of Michigan. <br> Notes. ' - ' indicates data not available. See appendix B for definition of variables in table. <br> § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: The $N \mathbf{s}$ in this table are based on the entire sample at each grade level. Some drug use questions are asked only in some of the questionnaire forms rather than in all, in which case these $N \mathrm{~s}$ need to be adjusted appropriately. Look under Notes in each table to see if only a fraction of the sample was asked about that drug. If there is no such indication, the entire sample received the question. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\mathrm{a}} \mathrm{N}$ s for each racial subgroup represent the combination of the specified year and the previous year. Data have been combined to increase subgroup sample sizes and thus provide more stable estimates. See appendix B for details on how race/ethnicity is defined. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Source. The Monitoring the Future study, the University of Michigan. <br> Notes. ' - ' indicates data not available. See appendix B for definition of variables in table. <br> § Insufficient data for 2020 estimate. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Caution: The $N \mathrm{~s}$ in this table are based on the entire sample at each grade level. Some drug use questions are asked only in some of the questionnaire forms rather than in all, in which case these $N \mathrm{~s}$ need to be adjusted appropriately. Look under Notes in each table to see if only a fraction of the sample was asked about that drug. If there is no such indication, the entire sample received the question. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ${ }^{\mathrm{a}} N \mathrm{~s}$ for each racial subgroup represent the combination of the specified year and the previous year. Data have been combined to increase subgroup sample sizes and thus provide more stable estimates. See appendix B for details on how race/ethnicity is defined. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Caution: The $\boldsymbol{N} \boldsymbol{s}$ in this table are based on the entire sample at each grade level. Some drug use questions are asked only in some of the questionnaire forms rather than in all, in which case these $N s$ need to be adjusted appropriate Look under Notes in each table to see if only a fraction of the sample was asked about that drug. If there is no such indication, the entire sample received the question. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

[^2]:    ${ }^{5}$ OMB utilizes several names for geographic areas, such as Primary Metropolitan Statistical Areas (PMSAs) which are component parts of Consolidated Metropolitan Statistical Areas (CMSAs). For example, in June 1990, the Ann Arbor MI PMSA and Detroit MI PMSA constituted the Detroit-Ann Arbor MI CMSA. For the sake of simplicity, this document utilizes MSA throughout.
    ${ }^{6}$ For example, OMB currently defines the Detroit-Warren-Dearborn MSA as Wayne, Oakland, Macomb, Livingston, St. Clair, and Lapeer Counties, while MTF continues to define the Detroit MSA as Wayne, Oakland, Macomb, Livingston, St. Clair, Monroe, and Lapeer Counties, as OMB defined Detroit in June 1990.
